

02 October 2026

To whom it may concern,

My name is Daniel Lenton, and I am the CEO of Unify AI Ltd. I am writing this letter to express my strongest recommendation of Su Yee Julia Goh. Julia has worked with us twice. She first joined in June 2022 to work on Ivy, our open-source machine learning framework, where she had more than 200 pull requests merged and later led our work on AMD hardware backends for model deployment. When I was building a founding team in 2025 I asked her to come back, and she rejoined us as a founding engineer in April 2025.

Julia was one of the main engineers behind our AI assistant platform, with more than 2,000 commits across our codebases. In her first weeks back she built our communication service from scratch, which let an assistant talk to people by phone and by message. Over the following year she built many of our messaging channels end to end, often within a few days. Our Slack and Microsoft Teams integrations were largely her work.

She gave our assistants computers of their own. In early 2026 she built the system that ran a cloud desktop for each assistant, with a pool of machines kept warm so an assistant could get one straight away, and she did the security hardening for it. She started our desktop app, which let people connect their own computers to their assistant, and wrote most of it. She also got our assistants into meetings, first through a browser in Google Meet and later through an audio bridge that could tell speakers apart.

Julia was just as happy to take on foundations and work outside engineering. In late 2025 she wrote our organisations and permissions system and added foreign keys to our data store, both with extensive tests. This summer she took our Microsoft Teams app through Microsoft's store validation until it was approved, and she prepared our Google CASA security assessment with the external assessors.

What stands out most about Julia is how much she owns without needing to be managed. She started two of our codebases from scratch and was still the main author of large parts of them when she left. She writes careful, well-tested code, and she is a pleasure to work with.

Julia's role ended only because the team size had further reduced to focus on research, and it had nothing to do with her work. She is one of the strongest engineers I have worked with, and I would hire her again without hesitation, as I already have once. I am confident that she will perform exceptionally well in whatever role she takes on next.

I am very happy to provide more information if needed.

Thanks a lot,
Daniel Lenton
